The dashboard was deployed on Vercel and is available at nyc-airbnb-market-explorer.vercel.app. This deployment made it possible for peer users to interact with the system outside the local development environment and provide lightweight usability feedback based on the live interface.

To gather lightweight usability feedback, two peer users explored the dashboard and commented on clarity, interaction, and visual design. Their feedback directly informed several refinements in the final system.

User 1 commented that the spatial map was initially too small and did not feel like the primary view of the dashboard. The same user also noted that the map legend originally showed color variation without clearly indicating what values the colors represented. Based on this feedback, the map was enlarged and emphasized as the dominant view in the interface, and the legend was revised to better communicate the meaning of the color scale.

User 2 focused on interaction and readability. This user found ZIP code filtering inconvenient when many options were present, since there was initially no *Select All* control. The same user also noted that room type filtering was too restrictive when only single selection was allowed, and that the basemap colors were visually too strong, making the revenue markers harder to read. In response, the dashboard was updated to support ZIP code *Select All/Clear* actions, multi-select room type filtering, and a lighter basemap style that improves marker visibility.

Although this feedback was informal and limited in scale, it helped improve the usability and interpretability of the final dashboard. In particular, it strengthened the spatial hierarchy of the interface and made filtering interactions more practical for exploratory use.
